

Use & care

COSAPOTS planters are made for indoor and outdoor use. This guide covers planting, moving, cleaning and temperature. Damage from misuse is not covered by the warranty.

PLANTING

- 1 **Drainage.** For outdoor use, drill drainage holes in the base before planting. Follow the drainage hole guidelines for the number, size and placement of holes. The raised base lets excess water flow away.
- 2 **Drainage layer.** Add a layer of porous substrate equal to at least 10% of the planter's height. A plant specialist can advise on watering for the planter's size and the plant's needs.
- 3 **Soil.** Choose a soil suited to the plant and fill to the underside of the inner rim, no higher. This keeps the inner rim visible, keeps the roots closer to the watering level and makes the planted planter more stable.
- 4 **Top layer.** Cover the soil with bark chippings or a similar decorative topping to keep weeds down and stop wet soil from splashing onto the rim.

Important: Protect floors from water and soil runoff. The Pots Company US is not liable for collateral damage.

Moving & cleaning

MOVING

COSAPOTS planters ship in a cardboard carton with protective collars and paper. Leave the planter in its wrapping until it reaches its final location.

A planted COSAPOTS planter is very heavy. Move or lift it only on a strong pallet or crate. Do not attach straps to the planter. Open the box from top with a utility knife. With the box facing upright, remove the planter from the box vertically. Be careful not to scrape the planter against the box. Do not use a utility knife elsewhere on the box.

Damage from transport or delivery is not covered by the warranty.

CLEANING

Use a damp cotton cloth with mild soap if needed.

Do not use dry microfiber cloths, melamine sponges, or other abrasive cloths or cleaners. Never use chemical or corrosive products.

TEMPERATURE

COSAPOTS planters are tested for sudden temperature changes from 5 °F to 176 °F (-15 °C to 80 °C).

In regions with freezing temperatures, outdoor planters must drain freely. Water that freezes inside a planter can damage it. See drainage hole guidelines for instructions on adding drainage.
